QUARK APPLICATION NOTE

megatel Q-TIP #4 USING THE QUARK'S PERIPHERAL EXPANSION INTERFACE

INTRODUCTION

The purpose of this Application Note is to assist the user in the use of the Peripheral Expansion Interface on the Megatel Quark family of single board computers. The note discusses and provides schematics showing how 8080-, 6500-, and 6800-type peripheral devices can be connected to a Quark. A schematic is also included to illustrate how the Quark's address, data and control lines can be buffered.

DESCRIPTION

The various members of the Quark family of single board computers provide all of the functions necessary to integrate standard peripheral devices into many complete, stand-alone computer systems. Sometimes though, special or additional I/O functions are needed in some applications. The Quark can accommodate these special functions through its Peripheral Expansion Interface. The Interface provides external access to the eight data lines, the six least-significant address lines, and to appropriate timing and control lines.

The Read (RD) and Write (WR) lines generated by the Z80B are brought out on the Peripheral Expansion Interface. These two lines would be used with some 8080-compatible peripheral devices, such as the 8251 UART or the 8255 PPI. Other 8080-compatible devices (chiefly A-version types like the 8255A) require that the Address and CS lines be stable before WR goes low. Check the timing diagrams for the device against the timing diagram for the Quark given in Figure 1. If the Address and CS lines need not be stable before the WR, then connect the device as shown in Figure 2. Alternatively, if the CS must be stable before the WR goes low, then connect the device as shown in Figure 3.

To connect 6500- and 6800-compatible devices, the E-clock output and the WR line are used. For these devices, the WR line functions as the 6500/6800 RD/WR line. See Figure 4.

The Z80B's Interrupt Input line (INT) is available on the Peripheral Expansion Interface to allow external devices to generate interrupts to the Z80B. The active-low Power-On-Reset output (POR) is also provided to reset external peripheral devices. Finally, a decoded active-low chip-select line (CS) corresponding to I/O address between C0 and FF (hex) is created on-board and can be used to select a single external peripheral device, or to qualify the decoding of some of the address lines for several external chip-select lines. See Figure 5.

Figure 6 illustrates an application of this decoding process.

The POR output on the Peripheral Expansion Interface is an active-low buffered reset output which should be used in resetting external peripheral devices. Note that 8080-type devices require an active-high reset signal, so the POR line would have to be inverted to service these devices.

To ease timing requirements for interfacing external peripheral devices to the 6MHz CPU, four wait states are added to all I/O cycles. These four T-states are in addition to those which are added to extend every memory cycle to mod-4 T-states. Thus an I/O instruction which would execute in 10 cycles, for example, would be first extended to 12 cycles and then further extended to 16 cycles. This relaxes the bus timing requirements for I/O operations, thus allowing lower speed and lower cost peripheral devices, such as "A"-version (1.5MHz) 6800/6500 devices, to be used.

If several external peripheral devices are to be connected to the Quark's Peripheral Expansion Interface, or if the Interface's lines are to be extended any significant distance, it is recommended that the address, data, and control lines being used be buffered by TTL drivers. Figure 7 shows a schematic for buffering all of the available data and address lines, and some of the control lines. Two TTL packages are sufficient for this purpose if only 8080- or only 6500/6800-type peripheral chips are used. If both types are employed then an additional buffer is necessary, unless five or fewer address lines are required.

Megatel offers a number of Quark Transition Board (QTB) products to assist the user in the use of the Quark and its Peripheral Expansion Interface. For information on any of these products, or for further technical support on the use of the Interface, please contact the factory or your local distributor.
