;    0034  0      !
;    0035  0      !       This module contains the support routines required to perform QA on diagnostic programs.
;    0036  0      !
;    0037  0      ! AUTHOR:
;    0038  0      !
;    0039  0      !       Jack Stansbury
;    0040  0      !
;    0041  0      ! CREATION DATE:
;    0042  0      !
;    0043  0      !               15-October-1981, Version 6.5-00
;    0044  0      !       00      Put in code for all the support routines plus the following check routines: QA$Normal_Start,
;    0045  0      !               QA$Multiple_Pass, QA$Loop_On_Test, QA$Run_Backwards.
```

```
;    0047  0      ! MODIFIED:
;    0048  0      !
;    0049  0      !       01      Jack Stansbury, 14-December-1981, Version 6.6
;    0050  0      !               Added remaining QA check routines. Split QA.B32 into two different modules: QAMAIN.B32
;    0051  0      !               (this one) and QACHECKS.B32. While this one contains the support routines, the latter contains
;    0052  0      !               the actual check routines.
;    0053  0      !
;    0054  0      !       02      Jack Stansbury, 5-Jan-1982, Version 6.6
;    0055  0      !               Changed the code in QA$Dump to not print R0 and R1 in the register dump. There is no need to
;    0056  0      !               print these since they are not saved by the CALLx instructions.
;    0057  0      !
;    0058  0      !       03      Jack Stansbury, 1-Feb-1982, Version 6.6
;    0059  0      !               Released the three Supervisors to BSDE to find bugs. This includes all the check routine up to
;    0060  0      !               and including the Error Phase One check.
;    0061  0      !
;    0062  0      !       04      Jack Stansbury, 1-Feb-1982, Version 6.6
;    0063  0      !               Changed the headings on the two table printouts to make the table name more distinctive.
;    0064  0      !
;    0065  0      !       05      Jack Stansbury, 11-Feb-1982, Version 6.6X
;    0066  0      !               Changed the DSX$Branch routine so as to make it compatible with Sam Duncan! He wanted R0 saved
;    0067  0      !               across the branch macro code expansion, so I made significant changes to both the branch macros
;    0068  0      !               (in DIAG.*) and to this branch routine. All of that just for Sam!
;    0069  0      !
;    0070  0      !       06      Jack Stansbury, 27-July-1982, Version 6.9
;    0071  0      !               Changed the spelling of the VDS ^C handler variable.
;    0072  0      !
;    0073  0      !       07      Jack Stansbury, 19-Jan-1983, Version 6.10 (?)
;    0074  0      !               Took out all the references to any of the checks above the Run Backwards check. This
;    0075  0      !               includes taking out the previously entered Error Phase One check. It doesn't work
;    0076  0      !               properly with subroutines in diagnostic programs.
;    0077  0      !
;    0078  0      !       08      Bob Bergazzi    May 17, 1983    Version 6.11
;    0079  0      !               Changed the order of searching libraries.
;    0080  0      !--

;    0401  1      %SBTTL 'DSX$BRANCH'
;    0402  1
;    0403  1      GLOBAL ROUTINE DSX$Branch (Register_0, Branch_Code, Error_Number, Branch_Value) : Call_DSX$Branch =
;    0404  1
;    0405  1      !++
;    0406  1      ! FUNCTIONAL DESCRIPTION:
;    0407  1      !
;    0408  1      !       This global routine is called by the $DS_Branch macros. It decides if the branch should be taken.
;    0409  1      !       If the QA flag is set, it will call QA$Main, which calls the appropriate check routine. NOTE:
;    0410  1      !       This routine preserves R1 and attempts to preserve R0 when not forcing an error. At most, the low
;    0411  1      !       bit of R0 will be changed.
;    0412  1      !
;    0413  1      ! FORMAL PARAMETERS:
;    0414  1      !
;    0415  1      !       Register_0    : The general register R0.
;    0416  1      !
;    0417  1      !       Branch_Code   : A literal defining what type of branch is being executed by the diagnostic.
;    0418  1      !
;    0419  1      !       Error_Number  : A diagnostic error number.
;    0420  1      !
;    0421  1      !       Branch_Value  : The value that will determine whether or not the branch should actually be taken.
;    0422  1      !
;    0423  1      ! CALLER(S):
;    0424  1      !
;    0425  1      !       The diagnostic program.
;    0426  1      !
;    0427  1      ! IMPLICIT INPUTS:
;    0428  1      !
;    0429  1      !       NONE
;    0430  1      !

;    1456  1      ! FUNCTIONAL DESCRIPTION:
;    1457  1      !
;    1458  1      !       Find the user's last call frame by following the linked list
;    1459  1      !       of call frames. Find the first call frame whose saved PC is
;    1460  1      !       less than the starting location of the Supervisor. This should
;    1461  1      !       insure that that call frame was put on the stack when the user
;    1462  1      !       called a Supervisor service routine. This called frame will
;    1463  1      !       contain the saved PC, AP, FP, PSW, perhaps some of the general
;    1464  1      !       registers, and (indirectly) the SP.
;    1465  1      !
;    1466  1      ! CALLER:
;    1467  1      !
;    1468  1      !       QA$Dump - to find the call frame so it can print the debugging
;    1469  1      !                 information.
;    1470  1      !
;    1471  1      ! FORMAL PARAMETERS:
;    1472  1      !
;    1473  1      !       Frame_Start - will contain the starting location of the
;    1474  1      !                     found call frame.
;    1475  1      !

0000    48 ;                R. RIGGS        1-OCT-78        VERSION 3 (ESSAA-5.00)
0000    49 ;       03       INCLUDED QIO DATABASE INITIALIZATION ROUTINES
0000    50 ;                N.Howgate       26-Jun-79       Version 4 (ESSAA-5.01)
0000    51 ;       04       Add support for 11/750
0000    52 ;                Roger Riggs     03-NOV-1979
0000    53 ;       05       Added code to load drivers if not found in
0000    54 ;                IOC$GL_DPTLIST
0000    55 ;       06       Added fudge to generate 2 vectors for LPA11K
0000    56 ;                Roger Riggs, 5-Feb-1980, Version 5.2
0000    57 ;       07       Revamped setup of ACF block, Added code to maintain reference
```

```
                     58 ;               count in DPT headers, added code to handle headers on drivers
                     59 ;               header contains the number of vectors for unibus  devices
                     60 ;               Removes need for fudge in edit 06.
                     61 ;--
                     62 ;
                     63 ;       08      John Ciukaj     5-May-80        Version 5.4
                     64 ;
                     65 ;                 Added Dummy return for QIO related calls
                     66 ;
                     67 ;               Dave Butenhof   18-jun-1980,    version 5.5
                     68 ;       09      Remove all dummy returns from this module, and move to
                     69 ;               new module VMSDUMMY.
                     70 ;               Roger Riggs, 10-Aug-1980
                     71 ;       10      Use QIO driver prefix from controller instead of device
                     72 ;               this allows for terminals to be connected to more than
                     73 ;               one type of Async controller.  The first prefix
                     74 ;               encountered while linking back through the P-tables is
                     75 ;               used.
                     76 ;
                     77 ;       11      - Jack Stansbury, 22-Oct-1981, Version 6.-
                     78 ;               Fixed truncation errors. Also added .LIBRARY statements
                     79 ;               for $DS and $DIAG. Also changed .PSECT SEP to WORK, CODE,
                     80 ;               and DATA where appropriate.
                     81 ;
                     82 ;       12      - Jack Stansbury, 12-Nov-1981, Version 6.-
                     83 ;               Changed the HALTD to HALT.
                     84 ;
                     85 ;       13      Marion Baggett, 9-Apr-1982, Version 6.7
                     86 ;               Added .NoShow Conditionals after .IDENT statement.
                     87 ;
                     88 ;       14      Jack Stansbury, July 1, 1982, Version 6.8
                     89 ;               Added the 'real' Exe$PwrTimChk routine.
                     90 ;
                     91 ;       15      Marion Baggett, 24-Sept-1982, Version 6.9
                     92 ;               Changed the CASE instruction since WRITEVBLK and READVBLK
                     93 ;               are to far away and a JMP was need.
                     94 ;
                     95 ;       16      Richard E. Muse, 9 January, 1984, Version 6.14
                     96 ;               Added $PRDEF macro definition - VMS Version 4 change.
                     97 ;
                     98 ;       17      Domenic Andella, 9-Apr-1984, Version 6.14
                     99 ;               Added code in FILL_ACF to handle case where
                    100 ;               an SBIA is attached, and it is necessary to
                    101 ;               'backtrack' another level.
                    102 ;
                    103 ;       18      Bob Bergazzi    24-Apr-1984     Version 7.0
                    104 ;                       - Changed FILL_ACF to set up R3 with the CSR
                    105 ;                         address for the subsequent call to FIND_ADP.
                    106 ;                       - Changed FIND_ADP routine to compare ADP$L_CSR
                    107 ;                         instead of ADP$W_TR. This accomodates the VENUS
                    108 ;                         cpu with multiple SBIs.
                    109 ;                       - Changed INI_DRADP to add 100 or 300 to SCB_BASE
                    110 ;                         depending on which SBI the adapter is connected to.
                    111 ;                       - Removed UBINT... code from INI_UBADP since it
                    112 ;                         only needs the size of that code (UBINTSZ), which
                    113 ;                         is defined in ONLY8600.
                    114 ;

                     0259   671 ;++
                     0259   672 ; FUNCTIONAL DESCRIPTION:
                     0259   673 ;
                     0259   674 ;       This routine takes all the necessary steps to
                     0259   675 ;       insert a unit into the QIO database, including adding
                     0259   676 ;       ADP's, CRB's, IDB's, DDB's and UCB's.
                     0259   677 ;       The generic name of the device is used to locate the
                     0259   678 ;       device driver for the device.  Starting with the specified
                     0259   679 ;       device fields are copied from the P-table to the ACF block
                     0259   680 ;       which contains all the information necessary to build the
                     0259   681 ;       QIO database.  For unknown devices the unit and vector information
                     0259   682 ;       is copied. For a TM03 the unit is copied to only one of two fields.
                     0259   683 ;       For channels, (DR780, RH780 & DW780) the configuration register is set
                     0259   684 ;       and the ACF is complete. For all non-channel devices this process
                     0259   685 ;       is repeated for the link device, and then for it's link device...etc.
                     0259   686 ;       Note that it is impossible to catch the case where the TM03 is
                     0259   687 ;       omitted from the link chain for a magtape drive... i.e. no
                     0259   688 ;       error is reported.  Errors are reported if the channel is omitted.

```
Assembler run totals          2313     00:00:08.47    00:00:14.37

The working set limit was 3400 pages.
348441 bytes (681 pages) of virtual memory were used to buffer the intermediate code.
There were 90 pages of symbol table space allocated to hold 1693 non-local and 119 local symbols.
1786 source lines were read in Pass 1, producing 126 object records in Pass 2.
69 pages of virtual memory were used to define 60 macros.
```

Assembler run totals	1752	00:00:04.51	00:00:07.37

```
The working set limit was 2400 pages.
166703 bytes (326 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1171 non-local and 26 local symbols.
743 source lines were read in Pass 1, producing 76 object records in Pass 2.
21 pages of virtual memory were used to define 20 macros.
```

Macro library statistics

Psect synopsis output	2	00:00:00.00	00:00:00.00
Cross-reference output	4	00:00:00.06	00:00:00.13
Assembler run totals	1856	00:00:04.89	00:00:08.44

The working set limit was 2900 pages.
220656 bytes (431 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 1072 non-local and 26 local symbols.
595 source lines were read in Pass 1, producing 72 object records in Pass 2.
37 pages of virtual memory were used to define 36 macros.

Macro library statistics

Macro library name	Macros defined
DISK$DS:[DS.LOCAL.RELEASE.WORK]DS.MLB;1	2
DISK$DS:[DS.LOCAL.RELEASE.WORK]DIAG.MLB;1	11
DISK$DS:[DS.LOCAL.RELEASE.WORK]PAMAC.MLB;1	0
SYS$COMMON:[SYSLIB]LIB.MLB;2	10
SYS$COMMON:[SYSLIB]STARLET.MLB;2	9
SYS$COMMON:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	32

1549 GETS were required to define 32 macros.

There were no errors, warnings or information messages.

Psect synopsis output	2	00:00:00.00	00:00:00.00
Cross-reference output	2	00:00:00.01	00:00:00.01
Assembler run totals	1482	00:00:02.26	00:00:05.26

The working set limit was 1900 pages.
82358 bytes (161 pages) of virtual memory were used to buffer the intermediate code.
There were 20 pages of symbol table space allocated to hold 317 non-local and 23 local symbols.
272 source lines were read in Pass 1, producing 30 object records in Pass 2.
18 pages of virtual memory were used to define 17 macros.

;    0116  0      !       17      M. Baggett      23-Feb-1983     Version 6.11
;    0117  0      !               Added support for RC25 booting and file operations.
;    0118  0      !
;    0119  0      !       18      M. Baggett      1-March-1983    Version 6.11
;    0120  0      !               Added LESI,RCF25 and support for booting CI-HSC50.
;    0121  0      !
;    0122  0      !       19      M. Baggett      17-May-1983     Version 6.11
;    0123  0      !               Added changes to support CI-HSC50 port station #.
;    0124  0      !       20      M. Baggett      22-Sep-1983     Version 6.13
;    0125  0      !               Changed name LESI to RC11
;    0126  0      !
;    0127  0      !       21      M. Baggett      11-Oct-1983     Version 6.13
;    0128  0      !               Added support for CI-HSC50 tape and TS05
;    0129  0      !
;    0130  0      !       22      Domenic Andella 1-Mar-1984      Version 6.13
;    0131  0      !               Added code in routines DSX$CHECK_SUPPORT and
;    0132  0      !               RMS$OPEN for 8600 CPU. Each routine uses code
;    0133  0      !               to 'backtrack' through ptables till _LINK field
;    0134  0      !               equals zero, when this occurs the present Ptable
;    0135  0      !               is linked to HUB. Not so for a VENUS, when ptable
;    0136  0      !               _LINK field equals zero it means were linked to
;    0137  0      !               to an SBIA since the HUB is ABUS.  Therfore the
;    0138  0      !               modifications have to do with saving and reloading
;    0139  0      !               the previous adapter and controller address if running on a VENUS.
;    0140  0      !
;    0141  0      !       23      Bob Bergazzi    April 13, 1984  Version 7.0
;    0142  0      !               Changed DSX$Check_support to support ODS format on
;    0143  0      !               the console storage device for the ZZZ cpu.
;    0144  0      !
;    0145  0      !       24      M. Baggett      28-aug-1984     Version 7.1
;    0146  0      !               Changed controller for RC25/RCF25 from RC11 to LESI
;    0147  0      !               so devices could be accessed.
;    0148  0      !
;    0149  0      !       25      M. Baggett      5-Oct-1984      Version 7.1
;    0150  0      !               Change TAPE in support_table to allow operaton on HSC50 tape.
;    0151  0      !

;  0193  0     !
;  0194  0     !       39      M. Baggett      22-Aug-1985     Version 9.0
;  0195  0     !               Ultrix updates.
;  0196  0     !
;  0197  0     !       40      Richard E. Muse  2-Oct-1985     Version 9.0
;  0198  0     !               Added code in routines DSX$CHECK_SUPPORT and
;  0199  0     !               RMS$OPEN for the NAUTILUS CPU. Each routine uses code
;  0200  0     !               to 'backtrack' through ptables till the _LINK field
;  0201  0     !               equals zero, when this occurs the present Ptable
;  0202  0     !               is linked to HUB and thus the adapter/controller's
;  0203  0     !               address is available.  Not so for a NAUTILUS,when
;  0204  0     !               the ptable _LINK field equals zero it means were linked to
;  0205  0     !               to an NBIA which in turn has an NBIB linked to it. Therfore
;  0206  0     !               the modifications have to do with saving and reloading
;  0207  0     !               adapter/controller address back two levels
;  0208  0     !               if running on a NAUTILUS.
;  0209  0     !
;  0210  0     !       41      J. Baranski     3-Feb-1986      Version 9.1
;  0211  0     !               Add RA82 to KBD50 and UDA50 Device Support Tables.
;  0212  0     !
;  0213  0     !       42      M. Baggett      11-Feb-1986     Version 10.0                    !G:4
;  0214  0     !               Change device type code for KFTBA to BTD$K_BVPSSP.              !G:2
;  0215  0     !                                                                               !G:4
;  0216  0     !       43      Ted Salem       4-March-1986    Version 10.0                    !G:4
;  0217  0     !               Modified $OPEN $CLOSE $READ $GET and DSX$CHECK_SUPPORT          !G:4
;  0218  0     !               to support the ANDROMEDA console using the PPA console          !G:4
;  0219  0     !               interface (PPIFACE.MAR) instead of a device driver.             !G:4
;  0220  0     !                                                                               !G:4

                     0000     79 ;                  levels 6,9,10,11, to dispatch to EXE$FORKDSPTH
                     0000     80 ;                  John Ciukaj, 5-feb-80.    Version 5.2
                     0000     81 ;          18      Delete 'MOVAB   IS(R3),(R2)' causing exception while
                     0000     82 ;                  running diagnostic ECKAX, Exception depended on value
                     0000     83 ;                  of R2 on entry to DS$INITSCB
                     0000     84 ;                  Roger Riggs, 21-Mar-1980
                     0000     85 ;          19      Added EXE$GL_SCB to hold address of current SCB.
                     0000     86 ;                  Roger Riggs, 18-SEP-1980, Version 6.0
                     0000     87 ;          20      Added code to DS$INITSCB to restart the clock
                     0000     88 ;                  Dave Butenhof, 18-feb-1981, version 6.3
                     0000     89 ;          21      Also allow SETVEC w/out changing address
                     0000     90 ;          22      Fix several truncation errors
                     0000     91 ;
                     0000     92 ;          23      - Jack Stansbury, 22-Oct-1981, Version 6.5
                     0000     93 ;                  Fixed several truncation errors. Changed SEP Psects to
                     0000     94 ;                  what they should be. Added .LIBRARY statements for
                     0000     95 ;                  $DS and $DIAG.
                     0000     96 ;
                     0000     97 ;          24      Jack Stansbury, 15-September-1982, Version 6.9
                     0000     98 ;                  Added code in the SetVec routine that will take care of a race
                     0000     99 ;                  condition with the interval clock interrupts and an MTPR
                     0000    100 ;                  instruction that turns off the clock. Also changed the ICCS$M_ERR
                     0000    101 ;                  to be bit 15, instead of bit 31.
                     0000    102 ;
                     0000    103 ;          25      Jack Stansbury, 16-September-1982, Version 6.9
                     0000    104 ;                  Changed the ICCS$M_Err bit back to 31. The VAX Hardware Handbook
                     0000    105 ;                  has a picture of the ICCS longword in the back of the book. This
                     0000    106 ;                  picture states that the ERR bit is bit 15. However, in other
                     0000    107 ;                  sections of the book (and in the SRM), the ERR bit is 15. The
                     0000    108 ;                  NEBULA hardware thinks it is 15 also.
                     0000    109 ;
                     0000    110 ;          26      Bob Bergazzi    21-Oct-1982     version 6.9
                     0000    111 ;                  Changed comments in DSX$SETVEC routine. Also see CLOCK.MAR [25]
                     0000    112 ;
                     0000    113 ;          27      Bob Bergazzi    April 26, 1983  Version 6.11
                     0000    114 ;                  Added call to ONLY_SCB in DSX$INITSCB which fixes the SCB for VENUS.

Performance indicators

Phase	Page faults	CPU Time	Elapsed Time
Initialization	27	00:00:00.03	00:00:00.19
Command processing	913	00:00:00.28	00:00:00.80
Pass 1	597	00:00:01.63	00:00:03.29
Symbol table sort	0	00:00:00.13	00:00:00.13
Pass 2	30	00:00:00.47	00:00:01.16
Symbol table output	2	00:00:00.04	00:00:00.13
Psect synopsis output	2	00:00:00.01	00:00:00.15
Cross-reference output	5	00:00:00.17	00:00:00.29
Assembler run totals	1578	00:00:02.76	00:00:06.14

The working set limit was 2400 pages.
84505 bytes (166 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 454 non-local and 33 local symbols.
733 source lines were read in Pass 1, producing 55 object records in Pass 2.
22 pages of virtual memory were used to define 19 macros.

Macro library statistics

                                0000     58 ;       05      Modified SCRIPT$OPEN to use RMS instead of load
                                0000     59 ;
                                0000     60 ;               Dave Butenhof, 10-sep-1980, Version 6.0
                                0000     61 ;       06      Fix user mode RMS GETLINE code to perform case translation
```

```
0000     63 ;        07      - Jack Stansbury, 22-Oct-1981, Version 6.5
0000     64 ;                Fixed truncation errors. Also added .LIBRARY statements for
0000     65 ;                $DS and $DIAG.
0000     66 ;
0000     67 ;        08      - Dave Butenhof, 12-Nov-1981, version 6.5
0000     68 ;                Implement SET VERIFY/CLEAR VERIFY function.  When cleared,
0000     69 ;                this flag will cause command script input not to be echoed.
0000     70 ;                This is basically for the System Functional Test (EVXBB).
0000     71 ;                                                                    ;G:9
0000     72 ;        09      - Dave Butenhof, 17-Nov-1981, version 6.5
0000     73 ;                Implement type code bytes for all prompts.  The type code
0000     74 ;                will not be used in comparison of script file prompts,
0000     75 ;                but will be typed out to console or log file, if BINARY
0000     76 ;                flag is set.
0000     77 ;
0000     78 ;        10      -Jack Stansbury, 18-Dec-1981, Version 6.6
0000     79 ;                Added a little code in SCRIPT$FLUSH that will clear out the
0000     80 ;                QA bit in the DSA flags. This is to insure that QA gets turned
0000     81 ;                off when a Control-C interrupts a diagnostic in a script file,
0000     82 ;                and a non-continuable command (i.e., one that causes the script
0000     83 ;                file to be flushed) is issued. Before, if a START command was
0000     84 ;                issued, and a Control-C was typed, and a subsequent START
0000     85 ;                command was typed, the second one could be screwed up.
0000     86 ;
0000     87 ;        11      -Jack Stansbury, 26-Feb-1982, Version 6.6
0000     88 ;                Added comments to the DS_GETLINE routine to aid in
0000     89 ;                deciphering it.
0000     90 ;
0000     91 ;        12      - Jack Stansbury, 18-Mar-1982, Version 6.?
0000     92 ;                Took out any reference to the TypMsg routine. This is so
0000     93 ;                that type-coding can be added. Also added some new DS macros
0000     94 ;                that should make this more understandable.
0000     95 ;
0000     96 ;        13      Marion Baggett, 31-Mar-1982, Version 6.7
0000     97 ;                Added SYS$LIBRARY:LIB/
0000     98 ;
0000     99 ;        14      Marion Baggett, 8-Apr-1982, Version 6.7
0000    100 ;                Added type coding.
0000    101 ;
0000    102 ;        15      Jack Stansbury, 12-Apr-1982, Version 6.7
0000    103 ;                Added support for the Customer Runnable Diagnostics package.
0000    104 ;
0000    105 ;        16      John Ciukaj,    4-Apr-1983,     version 6.11
0000    106 ;                - Redefined reference to CRD bits in DSA Flags to
0000    107 ;                  distinguish between online and offline
0000    108 ;
0000    109 ;        17      Peter Green,    20-Jul-1983,    version 6.12
0000    110 ;                Added code to support scripting where prompts are
0000    111 ;                printed to the terminal and an answer is given by
0000    112 ;                the user. This is only done when the script prompt
0000    113 ;                ends with "\\".
0000    114 ;
0000    115 ;        18      M. Baggett      25-Jan-1984     Version 6.14
0000    116 ;                Changed dynamic allocation of XAB, FAB, RAB to static form
0000    117 ;                so script files will work.
0000    118 ;
0000    119 ;        19      M. Baggett      8-Feb_1985      Version 8.1
```

```
0000    120 ;               Changed COPY_IT to not change apha characters to uppers
0000    121 ;               case if ULTRIX.
0000    122 ;
0000    123 ;       20      Ted Salem       March 22, 1985  Version 8.2
0000    124 ;               Added interlock code to DS_GETLINE.
0000    125 ;
0000    126 ;       21      M. Baggett      20-June-1985    Version 8.3
0000    127 ;               Change some ULTRIX names.
0000    128 ;
0000    129 ;       22      Amy Iorio       10-July-1985    Version 8.3
0000    130 ;               Put ASK> prompt in for $DSASKxxx macros.
0000    131 ;
0000    132 ;       23      Domenic Andella 25-Sept-1985    Version 9.0
0000    133 ;               Fixed two truncation errors, BSBW's to JSB's
0000    134 ;                                                                       ;G:5
0000    135 ;       24      I. Martin       23-June-1986    Version 10.2            ;G:5
0000    136 ;               Changed literal to symbolic string.                     ;G:3
0000    137 ;                                                                       ;G:7
0000    138 ;       25      Bob Bergazzi    9-Oct-1986      Version 10.4            ;G:7
0000    139 ;               Fixed previous edit.                                    ;G:7
0000    140 ;                                                                       ;G:8
0000    141 ;       26      Ingrid Martin   1-Apr-1987      Version 10.8            ;G:9
0000    142 ;               RRR updates (do like nautilus).                         ;G:8
0000    143 ;                                                                       ;G:9
0000    144 ;       27      Bob Bergazzi    15-apr-1987     Version 10.8            ;G:9
0000    145 ;               Removed extra JSB to CLK$RE_INIT because it is already called ;G:9
0000    146 ;               once in the preceding $DS_CLRVEC on the timer vector.  No     ;G:9
0000    147 ;               symptom observed.                                       ;G:9
0000    148 ;--

Pass 2	19	00:00:00.91	00:00:01.91
Symbol table output	2	00:00:00.06	00:00:00.25
Psect synopsis output	0	00:00:00.00	00:00:00.00
Cross-reference output	5	00:00:00.26	00:00:00.44
Assembler run totals	1840	00:00:05.23	00:00:10.64

The working set limit was 3400 pages.
204019 bytes (399 pages) of virtual memory were used to buffer the intermediate code.
There were 60 pages of symbol table space allocated to hold 1060 non-local and 60 local symbols.
1189 source lines were read in Pass 1, producing 80 object records in Pass 2.
74 pages of virtual memory were used to define 56 macros.

;    0055  0      ! [01] Dave Butenhof, 25-Mar-1982, version 6.7
;    0056  0      !       Fix order of non-paged pool and lookaside list typeouts,
;    0057  0      !       mask out region select bits (31, 32) on P0BR and P1BR addresses
```

```
;    0058  0      !       (to make them physical, not virtual), and change top-of-DS and
;    0059  0      !       physical-memory-size messages to show Kb, not bytes (easier to
;    0060  0      !       read).  Also, print amount of available buffer space on /Buffer,
;    0061  0      !       and cut down on code some by setting all option bits if /All is
;    0062  0      !       set, instead of checking it throughout.
;    0063  0      !
;    0064  0      ! [02] Richard Brown, 9-July-82, Version 6.8
;    0065  0      !       Add printing of debugger memory allocation.
;    0066  0      !
;    0067  0      ! [03] Jack Stansbury, 14-September-1982, Version 6.9
;    0068  0      !       Added showing the buffer count.
;    0069  0      !
;    0070  0      !       04      Bob Bergazzi    May 17, 1983    version 6.11
;    0071  0      !               Changed the order of searching libraries.
;    0072  0      !
;    0073  0      !       05      Bob Bergazzi    Aug 29,1983     Version 6.13
;    0074  0      !               Added the VRSETMEM routine which sets a new memory
;    0075  0      !               size and then starts VDS at 10000. Doesn't get
;    0076  0      !               here in user mode.
;    0077  0      !
;    0078  0      !       06      Bob Bergazzi    Feb 14, 1984    Version 6.14
;    0079  0      !               Fixed VRSETMEM to call INI$LOAD_DEVICE which
;    0080  0      !               makes ptables for the console and boot devices.
;    0081  0      !                                                                       !G:2

0000     72 ;                    Roger Riggs             07-Aug-78
0000     73 ;         12         Install test number range checking, also update DS$GL_NUMTEST.
0000     74 ;                    Fix so DS$M_DONFLG is set by DS_CLEANUP and not checked
0000     75 ;                    before calling it.
0000     76 ;         13         Changes reflected by new structure of basic loop.
0000     77 ;                    i.e. START and RESTART commands call test program directly
0000     78 ;                    Roger Riggs             23-OCT-1978     VERSION 07 (ESSAA-5.01)
0000     79 ;         14         Changes to VRSTART to support new QIO initialization.
0000     80 ;         15         Added code to verify that this program is compatible with
0000     81 ;                    this supervisor, via ENV$V_SUPER, Value must match
0000     82 ;                    ENV$_SUPER, in DIAG. Updated when supervisor interface
0000     83 ;                    changes REQUIRE diagnostic changes.
0000     84 ;                    Roger Riggs     4-Sept-1979
0000     85 ;         17         Removed check of APT flag during start command
0000     86 ;                    Roger Riggs, 14-Feb-1980, Vervsion 5.2
0000     87 ;         18         Changed so program will not be started if QIO initialization
0000     88 ;                    fails, QIO has already printed the error message.
0000     89 ;                    Roger Riggs, 12-Mar-1980, Version 5.3
0000     90 ;         19         In VRABORT or DSX$ABORT change mode back to kernel before
0000     91 ;                    doing cleanup but after the abort message is printed
0000     92 ;                    Roger Riggs, 5-Jun-1980, Version 5.4
0000     93 ;
0000     94 ;         20         Added code to change mode and stack back to kernel
0000     95 ;                    before calling cleanup as a result of start.
```

```
                                0000     97 ;        21      - dave butenhof, 09-Sep-1981, version 6.-
                                0000     98 ;                It is desirable, under APT, and if program error had
                                0000     99 ;                occured, to have ABORT leave machine state intact, for
                                0000    100 ;                purposes of isolating error.  Add special code to skip
                                0000    101 ;                INIT_CONTEXT and CLEANUP calls if in APT mode and error
                                0000    102 ;                flag set.
                                0000    103 ;
                                0000    104 ;        22      - Marion Baggett 80-oct-1981 Version 6.-
                                0000    105 ;                Added new entry point to support command SHOW SUPPORT
                                0000    106 ;
                                0000    107 ;        23      - Jack Stansbury, 21-Oct-1981, Version 6.-
                                0000    108 ;                Added calls to QA$MAIN for the QA enhancement.
                                0000    109 ;                Also added .LIBRARY statements for $DS and $DIAG.
                                0000    110 ;
                                0000    111 ;        24      - Jack Stansbury, 22-Oct-1981, Version 6.-
                                0000    112 ;                Fixed truncation errors.
                                0000    113 ;
                                0000    114 ;        25      - Jack Stansbury, 26-Oct-1981, Version 6.-
                                0000    115 ;                Changed most of the error messages to mixed case
                                0000    116 ;                (as per government affirmative action regulations)!
                                0000    117 ;
                                0000    118 ;        26      - Dave Butenhof, 19-Nov-1981, version 6.-
                                0000    119 ;                Add type codes to printouts
                                0000    120 ;
                                0000    121 ;        27      - Jack Stansbury, 16-Nov-1981, Version 6.5
                                0000    122 ;                Added the VRSHOWSECTIONS routine.
                                0000    123 ;
                                0000    124 ;        28      - Jack Stansbury, 21-Nov-1981, Version 6.5
                                0000    125 ;                Commented out three of the calls to QA_MAIN because it
                                0000    126 ;                appears they will not be needed for the 6.5 DS version.
                                0000    127 ;
                                0000    128 ;        29      - Jack Stansbury, 5-Jan-1982, Version 6.6
                                0000    129 ;                Added comments to the START routine in preparation for the
                                0000    130 ;                version 30 changes. Also took out the commented-out calls
                                0000    131 ;                to QA_MAIN since I will not be needing them.
                                0000    132 ;
                                0000    133 ;        30      - Jack Stansbury, 6-Jan-1982, Version 6.6
                                0000    134 ;                Added code and moved other code around in the START routine so
                                0000    135 ;                as to facilitate the "QA Start Loop".
                                0000    136 ;
                                0000    137 ;        31      - Jack Stansbury, 15-Jan-1982, Version 6.6
                                0000    138 ;                Changed the FMT_PROG header line so that it would print the
                                0000    139 ;                number of tests on the first line. Only the time appears on the
                                0000    140 ;                second line. This is in keeping with the EndPass message and
                                0000    141 ;                the End-Of-Looping message (in EndSub).
                                0000    142 ;
                                0000    143 ;        32      - Jack Stansbury, 20-Jan-1982, Version 6.6
                                0000    144 ;                Added code to not print the header line if the QA Loop on
                                0000    145 ;                Subtest check was executing and if a flag bit had been cleared.
                                0000    146 ;                This prevents the header line from being output once for every
                                0000    147 ;                subtest in the diagnostic when the Loop on Subtest check
                                0000    148 ;                routine is executing.
                                0000    149 ;
                                0000    150 ;        33      Marion Baggett, 9-Apr-1982, Version 6.7
                                0000    151 ;                Added .NoShow Conditionals after .IDENT , ordered .LIBRARY
                                0000    152 ;                statements. Change DS$PRINTF statement to use type codes
                                0000    153 ;
```

```
0000   154 ;        34      Richard Brown, 30-June-82, Version 6.8
0000   155 ;                Addition of call to MAP_DEBUGGER so repeated STARTs will
0000   156 ;                not wipe out the debugger once it has been loaded.
0000   157 ;                Also, addition of loading debugger before diagnostic is
0000   158 ;                started, if proper flag is set.
0000   159 ;
0000   160 ;        35      Marion Baggett, 24-Sept-82  Version 6.9
0000   161 ;                Fixed truncation error.
0000   162 ;
0000   163 ;        36      Bob Bergazzi    2-Nov-1982      Version 6.9
0000   164 ;                Changed VRSTART so that if we are loaded under APT do not
0000   165 ;                check the DSA$V_LOAD_DEBUGGER flag. APT sets this flag for
0000   166 ;                reasons long since lost. When running under APT, every
0000   167 ;                START would cause the supervisor to try and load the debugger
0000   168 ;                from the console device and cause APT to timeout.
0000   169 ;
0000   170 ;        37      Jack Stansbury, 8-Mar-1983, Version 6.11
0000   171 ;                Changed the abort routines to make sure they print the true
0000   172 ;                (if there is one) user PC.
0000   173 ;

Psect synopsis output	2	00:00:00.01	00:00:00.01
Cross-reference output	6	00:00:00.31	00:00:00.50
Assembler run totals	1866	00:00:04.85	00:00:09.21

```
The working set limit was 2900 pages.
202868 bytes (397 pages) of virtual memory were used to buffer the intermediate code.
There were 40 pages of symbol table space allocated to hold 643 non-local and 58 local symbols.
1110 source lines were read in Pass 1, producing 64 object records in Pass 2.
47 pages of virtual memory were used to define 31 macros.
```

Macro library statistics

Assembler run totals	2062	00:00:04.52	00:00:07.79

```
The working set limit was 2900 pages.
164186 bytes (321 pages) of virtual memory were used to buffer the intermediate code.
There were 80 pages of symbol table space allocated to hold 1365 non-local and 41 local symbols.
795 source lines were read in Pass 1, producing 87 object records in Pass 2.
19 pages of virtual memory were used to define 18 macros.
```

0000    30 ; ABSTRACT:
0000    31 ;       This module contains the bootstrap device driver for
0000    32 ;       MASSBUS TM03 based magtapes (TE16,TU77,TU45)
0000    33 ;
0000    34 ; ENVIRONMENT:  kernel mode
0000    35 ;
0000    36 ; AUTHOR:  Roger Riggs, CREATION DATE:  4-Sep-1980
0000    37 ;
0000    38 ;--
0000    39 ; Modified:
0000    40 ;
0000    41 ;                   Roger Riggs, 22-oct-1980, Version 6.1
0000    42 ;       01          Added code to support IO$_DRVCLR.
0000    43 ;       02          changed RET's to RSB for version 4 interface of Bootdrivr

```
The working set limit was 2900 pages.
136960 bytes (268 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1236 non-local and 12 local symbols.
389 source lines were read in Pass 1, producing 79 object records in Pass 2.
18 pages of virtual memory were used to define 17 macros.
```

0000    315          .SBTTL  TS11/TS04, TU80 Bootstrap driver
0000    316
0000    317 ;++
0000    318 ; Functional description:
0000    319 ;
0000    320 ;       This routine performs basic magnetic tape positioning.
0000    321 ;       functions are supported for read, rewind, skip files (forward
0000    322 ;       backward) and skip records (forward and backward). It also
0000    323 ;       support drive clear.  Drive clear must be called before the first
0000    324 ;       tape operation as it is necessary to initialize the tape subsystem
0000    325 ;       prior to the first position or transfer operation.
0000    326 ;       Drive clear initialization clears the Need Buffer Address (NBA)
0000    327 ;       bit in the drive. This bit can be reset by a UNIBUS reset/init
0000    328 ;       which in the TS11 causes the tape to be rewound. If NBA is set
0000    329 ;       the function is rejected with tape position lost.
0000    330 ;
0000    331 ; Inputs:
0000    332 ;
0000    333 ;       R3      - base address of adapter's register space
0000    334 ;       R5      - LBN for current piece of transfer
0000    335 ;       R6      - contains 0
0000    336 ;       R7      - Address of devices CSR
0000    337 ;       R8      - size of transfer in bytes
0000    338 ;       R9      - address of the RPB
0000    339 ;       R10     - starting address of transfer (byte offset in first
0000    340 ;                 page ORed with starting map register number)
0000    341 ;
0000    342 ;       FUNC(AP)- I/O operation (IO$_READLBLK or IO$_REWIND only)
0000    343 ;       MODE(AP)- Address interpretation mode (0 = physical, 1 = virtual)
0000    344 ;       SIZE(AP)- Size of buffer in bytes
0000    345 ;       BUF(AP) - Address of buffer
0000    346 ;
0000    347 ; Implicit inputs:
0000    348 ;
0000    349 ;       RPB$B_SLAVE     - Slave number of drive
0000    350 ;       RPB$W_UNIT      - RPB field containing boot device unit number
0000    351 ;
0000    352 ;
0000    353 ; Outputs:
0000    354 ;
0000    355 ;       R0 - status code
0000    356 ;
0000    357 ;               SS$_NORMAL      - successful transfer
0000    358 ;               SS$_TAPEPOSLOST - Tape position lost
0000    359 ;               SS$_TIMEOUT     - Device timeout
0000    360 ;               SS$_DATAOVERUN  - Record too long
0000    361 ;               SS$_ILLIOFUNC   - Illegal I/O function
0000    362 ;               SS$_CTRLERR     - Controller error
0000    363 ;               SS$_ENDOFFILE   - Tape mark was read
0000    364 ;               SS$_DEVOFFLINE  - Device is offline
0000    365 ;
0000    366 ;       R1 - Number of bytes transferred during a READ operation
0000    367 ; Register usage:
0000    368 ;
0000    369 ;               R5      - Map number of map for command area
0000    370 ;               R11     - Address of command buffer
0000    371 ;

Symbol table sort	1	00:00:00.37	00:00:00.37
Pass 2	69	00:00:00.76	00:00:01.53
Symbol table output	2	00:00:00.02	00:00:00.08
Psect synopsis output	2	00:00:00.01	00:00:00.01
Cross-reference output	4	00:00:00.08	00:00:00.11
Assembler run totals	1742	00:00:04.19	00:00:07.10

```
The working set limit was 2400 pages.
149901 bytes (293 pages) of virtual memory were used to buffer the intermediate code.
There were 70 pages of symbol table space allocated to hold 1303 non-local and 17 local symbols.
606 source lines were read in Pass 1, producing 85 object records in Pass 2.
19 pages of virtual memory were used to define 18 macros.
```

Macro library statistics

Macro library name	Macros defined
DISK$DS:[DS.LOCAL.RELEASE.WORK]DS.MLB;1	1
DISK$DS:[DS.LOCAL.RELEASE.WORK]DIAG.MLB;1	1
DISK$DS:[DS.LOCAL.RELEASE.WORK]PAMAC.MLB;1	0
SYS$COMMON:[SYSLIB]LIB.MLB;2	5
SYS$COMMON:[SYSLIB]STARLET.MLB;2	7
SYS$COMMON:[SYSLIB]STARLET.MLB;2	0
TOTALS (all libraries)	14

1201 GETS were required to define 14 macros.

There were no errors, warnings or information messages.

;    0826  1      !++
;    0827  1      ! Functional description:
;    0828  1      !
;    0829  1      ! Addresses stored in inodes are capable of addressing fragments
;    0830  1      ! of several blocks. File system blocks of at most size MAXBSIZE can
;    0831  1      ! be optionally broken  to 2, 4, or 8 pieces, each of which is
;    0832  1      ! addressible; these pieces may be DEV_BSIZE, or some multiple of
;    0833  1      ! a DEV_BSIZE unit.
;    0834  1      !
;    0835  1      ! Large files consist of exclusively large data blocks.  To avoid
;    0836  1      ! undue wasted disk space, the last data block of a small file may be
;    0837  1      ! allocated as only as many fragments of a large block as are
;    0838  1      ! necessary.  The file system format retains only a single pointer
;    0839  1      ! to such a fragment, which is a piece of a single large block that
;    0840  1      ! has been divided.  The size of such a fragment is determinable from
;    0841  1      ! information in the inode.  This field  is filled in when the disk
;    0842  1      ! is created.
;    0843  1      !
;    0844  1      ! The file system shows file size at the fragment level;
;    0845  1      ! to determine number of blocks, aligned fragments are examined.
;    0846  1      !
;    0847  1      ! The root inode is the root of the file system.
;    0848  1      ! Inode 0 can't be used for normal purposes and
;    0849  1      ! historically bad blocks were linked to inode 1,
;    0850  1      ! thus the root inode is 2. (inode 1 is no longer used for
;    0851  1      ! this purpose, however numerous dump tapes make this
;    0852  1      ! assumption, so we are stuck with it).
;    0853  1      !

;    0976  1       !
;    0977  1       ! Look at each inode in directory
;    0978  1       !
;    0979  1       ! A directory consists of some number of blocks of DIRBLKSIZ(currently 255)
;    0980  1       ! bytes, where DIRBLKSIZ is chosen such that it can be transferred
;    0981  1       ! to disk in a single atomic operation (e.g. 512 bytes on most machines).
;    0982  1       !
;    0983  1       ! Each DIRBLKSIZ byte block contains some number of directory entry
;    0984  1       ! structures, which are of variable length.  Each directory entry has
;    0985  1       ! a struct direct at the front of it, containing its inode number,
;    0986  1       ! the length of the entry, and the length of the name contained in
;    0987  1       ! the entry.  These are followed by the name padded to a 4 byte boundary
;    0988  1       ! with null bytes.  All names are guaranteed null terminated.
;    0989  1       ! The maximum length of a name in a directory is MAXNAMLEN.
;    0990  1       !
;    0991  1       !  All DIRBLKSIZ bytes
;    0992  1       ! in a directory block are claimed by the directory entries.  This
;    0993  1       ! usually results in the last entry in a directory having a large
;    0994  1       ! direct$w_d_reclen.   If the first entry of  a directory block is free,
;    0995  1       !  then its direct$l_d_ino is set to 0.  Entries other than the first
;    0996  1       ! in a directory do not normally have direct$l_d_ino set to 0.
;    0997  1       !

The working set limit was 2400 pages.
46032 bytes (90 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 439 non-local and 17 local symbols.
241 source lines were read in Pass 1, producing 40 object records in Pass 2.
9 pages of virtual memory were used to define 8 macros.

0007    111          .Sbttl  MUTEX Control Routines
0007    112
0007    113 ;++
0007    114 ; FUNCTIONAL DESCRIPTION:
0007    115 ;       Lock and unlock MUTEX database.  Since the Supervisor does not
0007    116 ; implement multi-programming, a 'MUTEX'-type lock is implemented via
0007    117 ; disabling AST delivery.
0007    118 ;
0007    119 ; CALLING SEQUENCE:
0007    120 ;       SCH$LOCKW -
0007    121 ;                JSB     SCH$LOCKW
0007    122 ;       SCH$UNLOCK -
0007    123 ;                JSB     SCH$UNLOCK
0007    124 ;
0007    125 ; INPUT PARAMETERS:
0007    126 ;       Ignored.  In Supervisor implmentation, which MUTEX is targeted for
0007    127 ; lock or unlock is irrelevant, since no data is accessed.
0007    128 ;
0007    129 ; IMPLICIT INPUTS:
0007    130 ;       none
0007    131 ;
0007    132 ; OUTPUT PARAMETERS:
0007    133 ;       none
0007    134 ;

Assembler run totals	1324	00:00:01.32	00:00:03.75

The working set limit was 2400 pages.
40786 bytes (80 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 421 non-local and 1 local symbols.
165 source lines were read in Pass 1, producing 36 object records in Pass 2.
8 pages of virtual memory were used to define 7 macros.
